Justi Repair Material

Justi Repair Material is a universal type repair material that is applicable for repairing all types of acrylic dentures, temporary prostheses and indirect relines. A self curing methyl methacrylate material that is cross-linked and internally pigmented to give a dense, even texture.

MIXING & HANDLING:

A mixture of 3 parts powder to 1 part of liquid is recommended for pour or packing technique. For attaching clasp or repairing broken appliances, the powder and liquid alternating technique may be used. Always use a separating medium such as tin foil or liquid tin foil on the model before applying the resin. All types of pressure pot techniques can be used. This will ensure a dense, porous-free repair.

Working time from initial mix is approximately 30 minutes; curing time is approximately 10 minutes in open air at normal room temperature.

TYPE OF PACKAGING:

Justi Repair Material is available in three shades of powder. Regular Pink, Regular Fibered Pink and Clear.

Group/Item # 072-06-0001 - Repair Material Kit
